The deposit of replication materials in 4 steps

To deposit replication materials linked to a publication and to receive a DOI, go to the [FORS replication service](https://resources.swissubase.ch/replication) (<https://resources.swissubase.ch/replication>) and follow these 4 steps:

The replication files to be shared

- **Data file(s)**, including all variables used in the analysis, or a link to the full dataset (DOI);
- All **codes** used for the analysis;
- **Readme files** that specify the instructions allowing to understand the other files and to produce the same results including instructions for data preparation and for data analysis;
- Any other files containing any other **necessary information** for the replication process.

The [FORS replication service](#) is a free solution for journals and researchers to facilitate the sharing of the replication materials underlying publications.

The advantages of the FORS replication service

- **Free** service for storing replication materials in Switzerland;
- Research processes and analysis codes are **transparent** and facilitate **methodological progress**;
- The potential validation of the findings brings **scientific credibility** and enhances researchers' **reputations**;
- The replication materials are fully citable with a **DOI**, which increases the **visibility** of the researchers and the **citation** of their publications.
